

Decoration FSL should be embroidered on two layers of a water-soluble stabilizer. If your water-soluble stabilizer has a high density, then you can embroider on one layer.

After the products are embroidered, the water-soluble stabilizer should be washed.

If it is a brooch or other product that must be tough and keep in shape, do not wash away the highly water-soluble stabilizer.

The product must then be dried. Sometimes you can use an iron, you need to put under the product and top a terry towel and iron it.

Then, according to your taste, the product can be decorated with beads, sequins, paillettes. And add hardware.

To attach the fittings to the decorations, you must make small holes with an awl or a thick needle.

Make holes with a thick needle or an awl. Using this method, you do not tear the threads to get a hole, but only pushes them apart in different directions.

In some designs, I make special loops for attaching fittings. But more often I use this method of attaching accessories, because the embroidered loops on the part look a little rough and spoil the appearance of the products.
